In Pursuit of Absolute Simplicity 求于至简，归于永恒

# Content

---

- ➔ What is operating system
- ➔ Why study operating system?
- ➔ History of operating system

## A Wise Man's Answer

---

- ➔ Once upon a time, a boy asked a wise man:
  - Can you tell if the bird I am holding behind is alive?
- ➔ If the answer is “yes”
  - The boy will crunch the bird and show the dead bird
- ➔ If the answer is “no”
  - The boy will let the bird fly and laugh at the man

## A Wise Man's Answer

---

- ➔ But the wise man would have no such foolishness
- ➔ What is the wise man's answer?
  - “As you will”

# Philosophy of Computer

---

- ➔ What is the defining property of computer?
  - A calculating machine?
  - A computation device?
- ➔ An artifact
  - A human creation (vs. God creation)
- ➔ Computer science is therefore an artifact science

# Artifact vs. True Science

---

## ➔ Artifact science:

- Inexact, relative
- Often derive from observation of human activities
- Subject to human discretion

## ➔ True science:

- Exact, absolute, no discretion is allowed
- Derive from study of nature (God-made)
- E.g. mathematics, physics, chemistry

# Example of Artifact Science

---

Stack

# Example of Artifact Science

---

Queue

# Example of True Science

---

$$E=MC^2$$

---

# Computer Science as Artifact

---

- ➔ Often there is no absolute right or wrong
  - Only better or worse
- ➔ There take what I teach with a grain of salt
  - Think creatively
  - Your solution may be better than mine

# The Three Questions

---

- ➔ What is an operating system?
- ➔ Main functions of the OS?
- ➔ Why study OS?

# What Is an Operating System?

---

- ➔ Something very important
  - Really not much help
- ➔ A software layer between hardware and applications

# What Is an Operating System?

---

Application Programs

Virtual machine interface

Operating System

Physical machine interface

Hardware

# What Is an Operating System?

---

- ➔ A program that
  - manages the hardware resources and
  - makes it easier to use by application
- ➔ by presenting nicer abstractions
  - i.e. the virtual machine

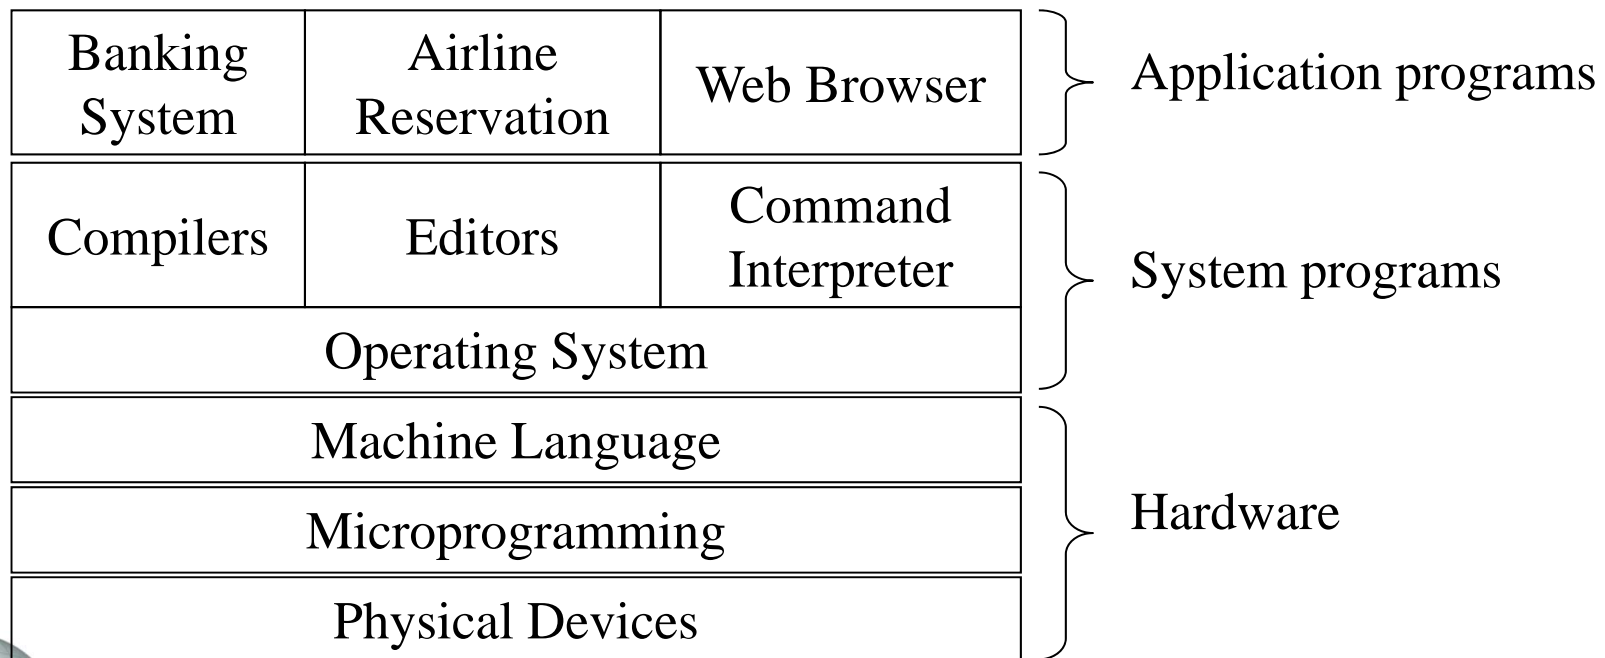

# What Is an Operating System?

---

- ➔ OS hides complexity of underlying hardware
- ➔ Layered architectures

# What Is an Operating System?

---

- ➔ For any area of OS, ask what interface does:
- ➔ The hardware present to the software
  - physical reality
- ➔ The OS present to its applications
  - the nicer abstraction

## Example Abstractions

---

### ⇒ Threads:

- user doesn't have to worry about sharing CPU

### ⇒ Addresses spaces:

- user doesn't have to worry about sharing physical memory
- or physical memory size

## Example Abstractions

---

### ⇒ TCP:

- user doesn't have to worry about the unreliable network

### ⇒ Device drivers:

- frees the user (the rest of the OS) from worrying about differences in devices
- e.g. the device registers used to control the device

# Operating System Areas

---

- ➔ Process (process/thread management)
- ➔ Virtual memory (memory management)
- ➔ File systems (storage management)
- ➔ Networking (communication management)
- ➔ I/O (input and output management)

# Relationship: User Programs and OS

---

## ➔ First perspective:

- User program is the main program, and
- Gets services by calling the kernel

## ➔ Second perspective:

- OS is the main program, and
- calls user programs as subroutines

## Two Main Functions of an OS

---

- ➔ Illusionist:
- ➔ Makes computer appear to be more or better
  - than it really is
- ➔ Examples?

## Two Main Functions of an OS

---

- ➔ Government:
- ➔ Parcels out single shared hardware resource to
  - multiple competing applications efficiently and fairly
- ➔ What hardware resources does OS manage?

# Tasks of an Operating System

---

- ➔ Processor management
  - Scheduling
- ➔ Memory management
  - Virtual memory
- ➔ Storage management
  - File system
- ➔ Device management
  - Input-Output
- ➔ Batch processing- Background processing

# Why Study Operating Systems?

---

- ➔ The functions of an OS appear in lots of domains
  - e.g. web server farm, concurrent applications
  - Distributed systems, networking
- ➔ Lots of techniques in OS are used in other domains
  - Designing and implementing an abstraction
  - Caching, indirection, concurrency, authentication,
  - naming, atomicity, resource allocation

# Why Study Operating Systems?

---

- ➔ Fun to “open the hood” and understand:
  - how the thing you’ve been using really works
  - Applicable only to those inquisitive minds
- ➔ May not at all be fun to many people!

# Operating System History

# History of Operating Systems

---

- ➔ OS history is dominated by two trends
- ➔ Decreasing hardware cost
  - But hardware started out VERY expensive,
- ➔ Increasing complexity of OS

## Single Operator at Console

---

- ➔ For first generation computer
  - ENIAC
- ➔ Goal: basic functionality
- ➔ Characteristics: interactive
- ➔ Time: 1940s (1946)
  
- ➔ Some people believe the first electronic computer is not ENIAC
  - Perhaps some military machine made during WWII

# Single Operator at Console

---

- ➔ OS is simple:
  - one thing happening on the computer at a time
- ➔ OS is just a library of standard services
- ➔ Drawbacks:
  - Poor utilization of computer
  - Idle while person thinks and while I/O device works

# Batch Processing

---

- ➔ For second generation of computers
  - IBM 1401, IBM 7094, etc.
- ➔ Goal: improve CPU and I/O utilization
  - by removing user interaction
- ➔ Example: FMS, IBSYS, UMES
  - FMS: FORTRAN Monitor System for the IBM 709
  - IBSYS: tape based OS for IBM 7090 and IBM 7094
  - MAD/UMES: University of Michigan Executive System
- ➔ Time: 1950s (1959)

## Batch Processing

---

- ➔ Both UM and MIT are owners of 7094
  - The most advanced computer at the time
- ➔ UM developed MAD language and UMES Operating Systems
  - R.M. Graham, Bruce Arden and Bernard Galler
- ➔ MAD/UMES was installed on MIT's 7094 computer
- ➔ R.M. Graham is one of the architect of Multics

# Batch Processing

---

- ➔ Submit job and wait for final answer
  - Use job cards, etc.
- ➔ No human interaction during execution

# Batch Processing

- ➡ Bring cards to 1401
- ➡ Read cards to tape
- ➡ Put tape on 7094 which does computing
- ➡ Put tape on 1401 which prints output

# Batch Processing

---

- ➔ Still only one job at a time
- ➔ OS is batch monitor & library of standard services
- ➔ Management of files, I/O devices, secondary storage
- ➔ Batch monitor loads program,
  - runs it, prints results, and starts next program

# Batch Processing

---

- ➔ Protection starts to become an issue
  - Must ensure that batch monitor can run next program in queue
- ➔ Why wasn't this an issue for “single operator at console”?

## Multi-programmed Batch

---

- ➔ For third generation of computers
  - System/360, 370, 4300, etc.
- ➔ Goal: improve CPU and I/O utilization
  - by overlapping CPU and I/O
- ➔ Example: OS/360(M)
  - For new generation and architecture of System/360 hardware - supporting both commercial and scientific applications
  - A powerful and very reliable OS developed by UM for IBM
- ➔ Time: 1960s (1964)

## Multi-programmed Batch

---

- ➔ Overlap disk I/O and CPU
  - Resource management and sharing for multiple programs
- ➔ Allows multiple I/Os to happen simultaneously
- ➔ Allows CPU and disk to work simultaneously
  - Quasi-simultaneous program execution

## Multi-programmed Batch

---

- ➔ Single user
- ➔ OS getting more complex:
  - OS switches between multiple processes
  - manages multiple I/O devices
- ➔ OS needs to protect processes from each other

# Batch Process

The elements of the basic IBM 1401 system are the 1401 Processing Unit, 1402 Card Read-Punch, and 1403 Printer.

Punching cards

Multiprocessing programming

# Time Sharing

---

- ➔ For third generation of computers or beyond
  - PDP, VAX, CRAY
- ➔ Goal: restore ability for humans to interact with programs
  - insight: human can be modeled as a I/O device
- ➔ Example:
  - CTSS: Compatible Time-Sharing System
  - MULTICS, derived from UMES
  - UNIX, derived from MULTICS

# Time Sharing

---

- ➔ Mgmt of multiple simultaneous users interconnected via terminals
  - Switch between programs when waiting for users
  - Switch back in time to get the next keystroke
- ➔ Fair resource management:
  - CPU scheduling, spooling, mutual exclusion
- ➔ OS getting more complex:
- ➔ Lots of simultaneous jobs
- ➔ Multiple sources of new jobs

# Real-Time Systems

---

- ➔ Some time called process control systems
- ➔ Management of time-critical processes
- ➔ High requirements with respect to:
  - reliability and availability

# Personal Computing

---

- ➔ For fourth generation of computers
  - PC, VAX, Workstation, etc.
- ➔ Computer hardware gets cheaper
  - economically feasible to go back to single operator
- ➔ OS re-becomes a subroutine library
- ➔ Example: DOS, Windows, Unix, Linux
- ➔ Don't need to time-share between multiple simultaneous jobs?
- ➔ Don't need protection?
- ➔ PC OS gradually added back most features from time-sharing

# Distributed Computing

---

- ➔ For networked generation of computing
- ➔ Goal: make multiple computers look like one
- ➔ Networking operating systems
  - Traditional OS with network interface management
  - Novell Netware
- ➔ Distributed operating systems
  - New type of OS with multiple computers in mind

# Cloud Computing

---

- ➔ For massive scale inter-networked generation of computing
- ➔ Goal: putting computing power on tap
- ➔ Cloud operating systems
  - Manage massive amount of resources
  - Load balance, computing/storage distribution, fault tolerance
- ➔ Typical Examples:
  - EMC, Google, Hadoop, Microsoft

# Cloud Computing

---

- ➔ EMC:
  - MPFS, Vmware, Engenity, DART
- ➔ Google:
  - GFS, BigTable, Map/Reduce, Borg, Chubby
- ➔ Hadoop,:
  - HDFS, Map/Reduce, ZooKeeper, HBase
- ➔ Microsoft:
  - Windows Azure, SQL Azure, Windows Azure AppFabric
  - Derive from Microsoft clustering

# Mobile Computing

---

- ➔ Google:
  - Android
- ➔ Apple:
  - iOS
- ➔ Microsoft:
  - Windows Phone 7
- ➔ Others:
  - Symbian

# Classification of OS

---

- ➔ OS for mainframe computers
  - OS/360, OS/390, CTSS
- ➔ OS for servers
  - UNIX, Windows 2000, Linux
- ➔ OS for multi-CPU computer
  - Novell Netware
- ➔ OS for cloud computing

# Classification of OS

---

- ➔ OS for personal computers
  - Windows 98, Windows 2000, Windows XP, MacOS
- ➔ OS for real-time systems
  - VxWorks (WindRiver), DART (EMC)
- ➔ OS for embedded systems
  - Palm OS, Windows CE, TOPPER
- ➔ OS for online computing systems
  - Google Chrome, Web 2.0

## Same Machine, Different OS

---

### ⇒ IBM PC:

- DOS, Linux, NeXTSTEP, Windows NT, SCO Unix

### ⇒ DEC VAX:

- VMS, Ultrix-32, 4.3 BSD UNIX

## Same OS, Different Machines

---

### ➔ UNIX

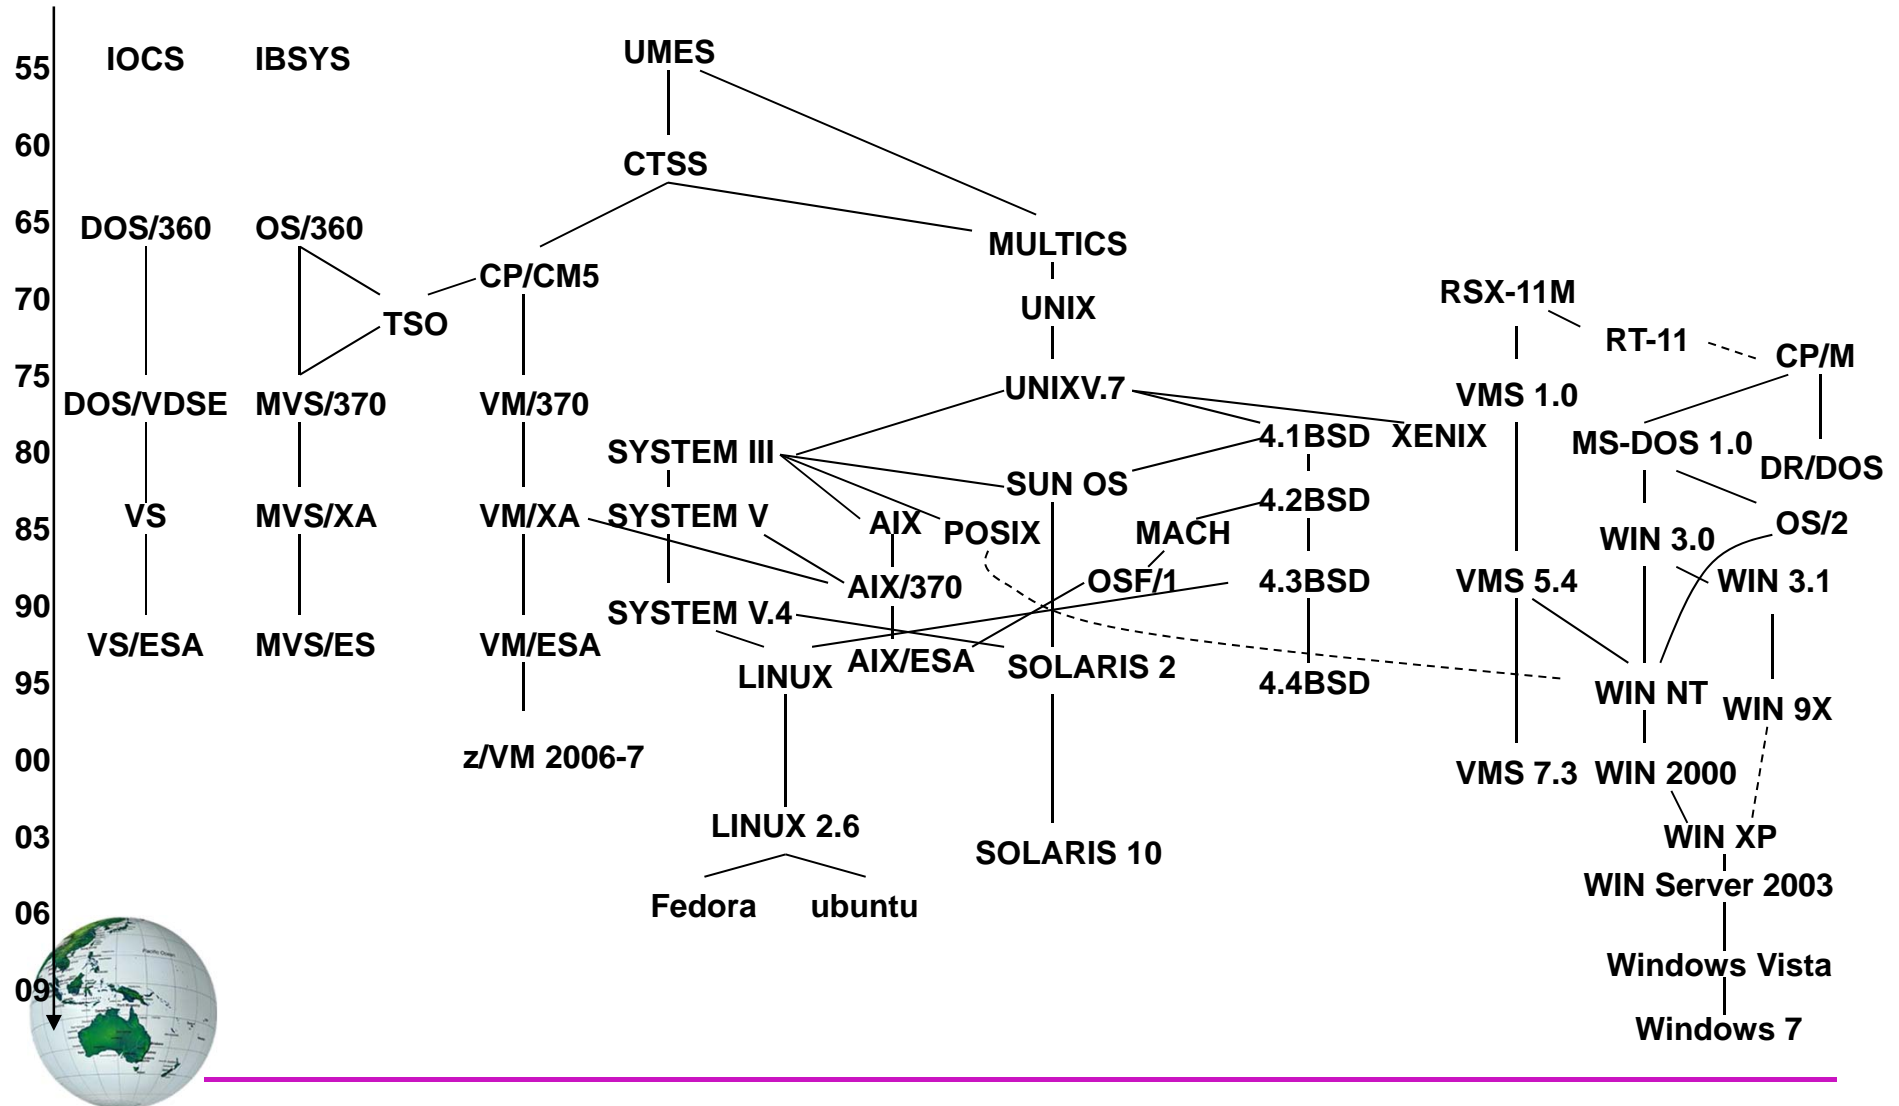

- PC (XENIX 286, APPLE A/UX)
- CRAY-Y/MP (UNICOS - AT&T Sys V)
- IBM 360/370 (Amdahl UNIX UTS/580, IBM UNIX AIX/ESA)

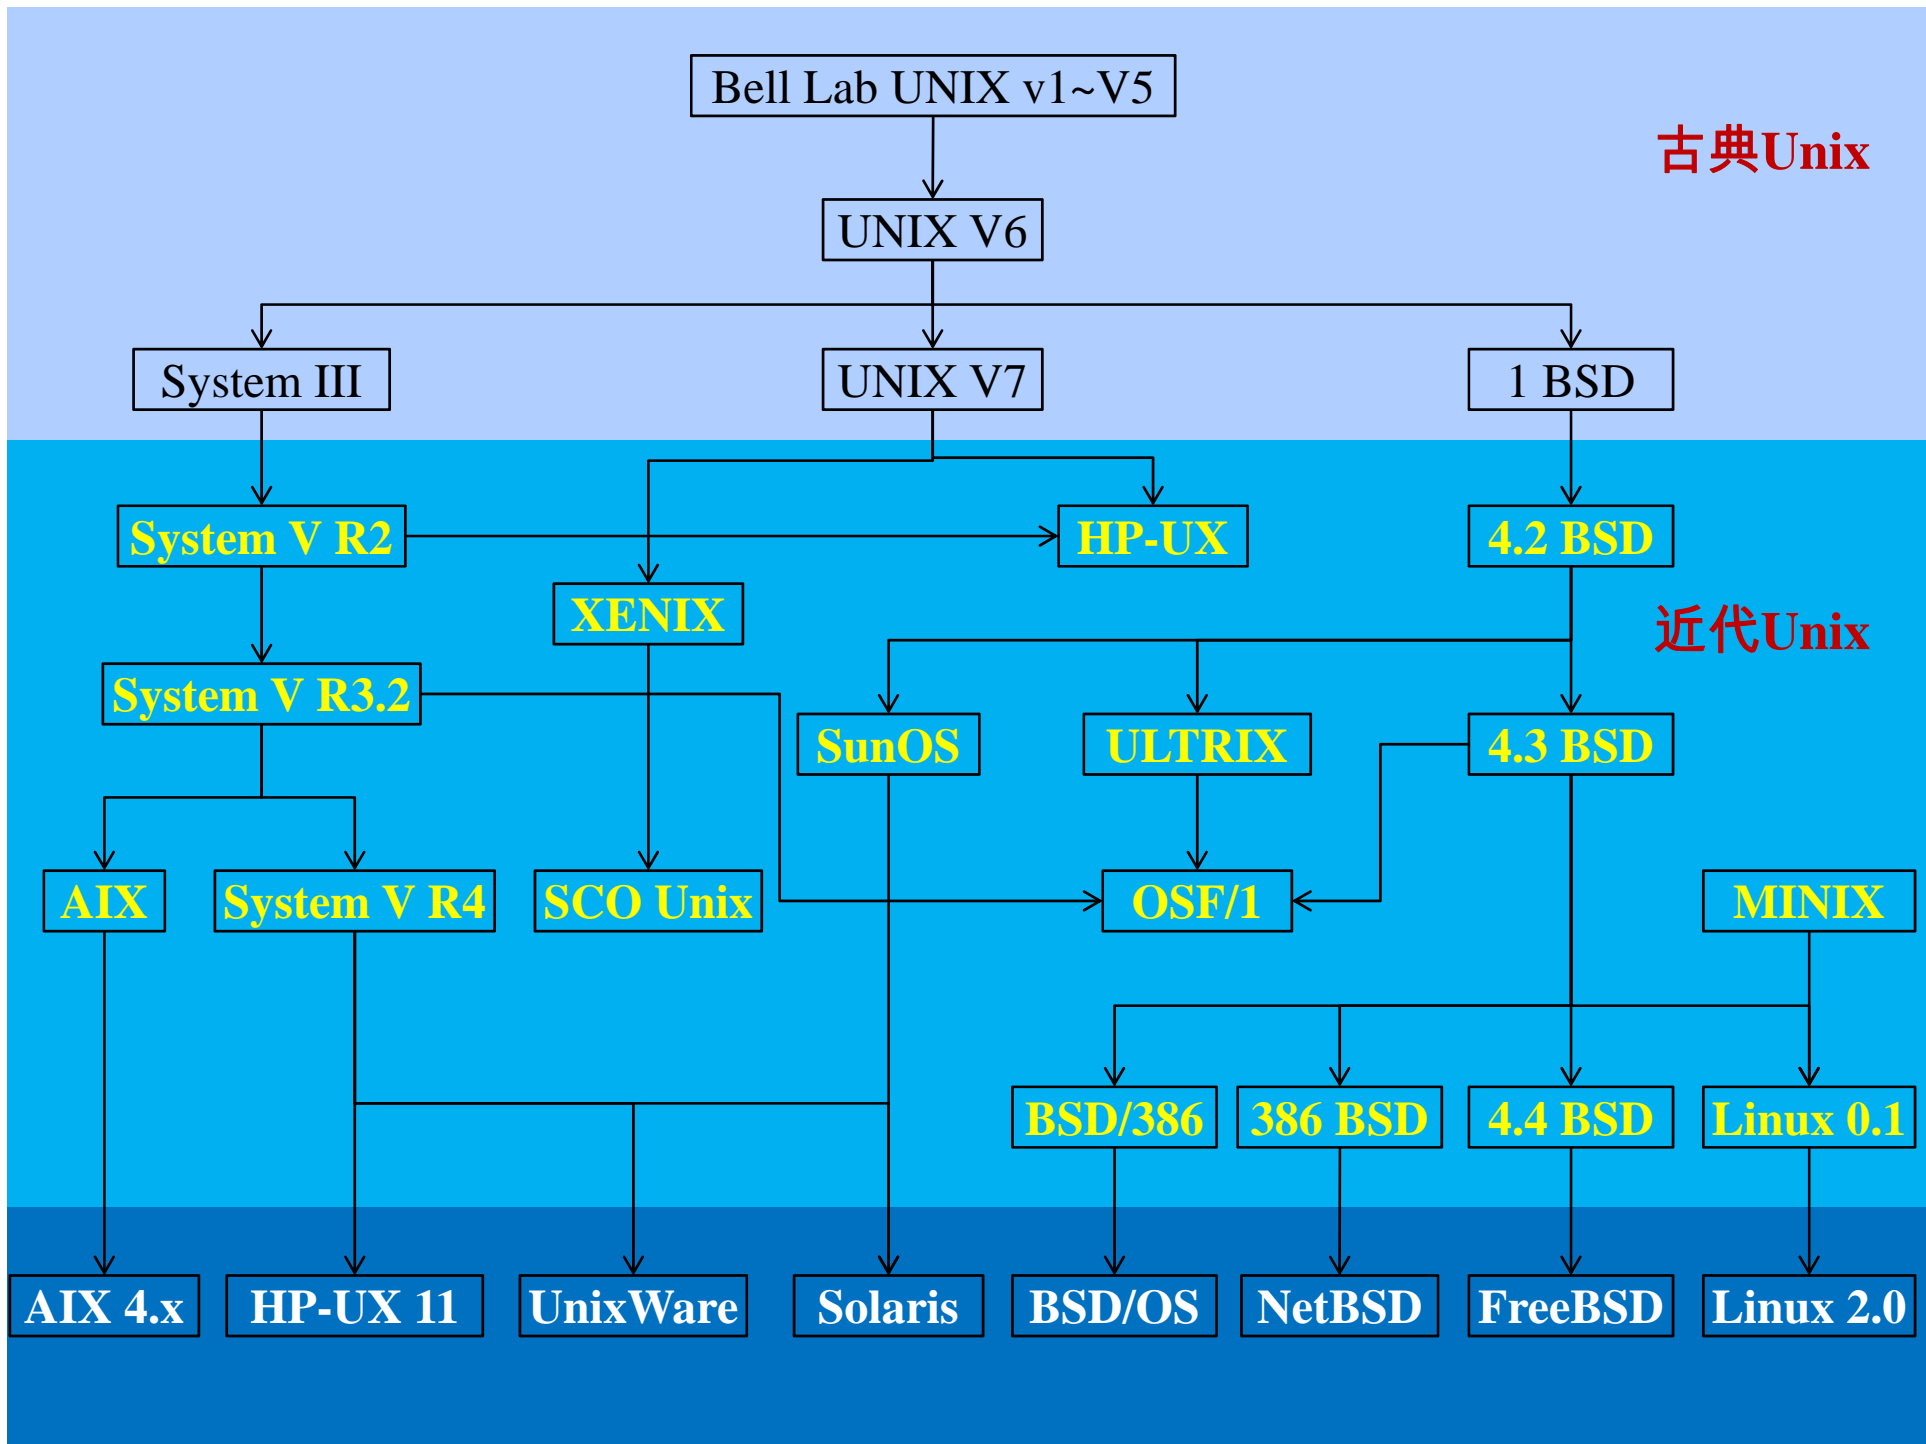

### ➔ Windows XP (or Windows NT/2000)

- Intel i386 (i486 an NT 4.0), Alpha (DEC)
- PowerPC (MOTO)
- MIPS (MIPS computer), Itanium (Intel)

# Operating Systems Evolution

# Windows Release History

---

WINDOWS	433000	71500	6.05

## Song: Every OS Sucks

---

- ➔ Every OS wastes your time, from desktop to the lap
- ➔ Everything since the abacus, is just a bunch of crap
- ➔ From Microsoft to Macintosh, to Linux Linu-nux
- ➔ Every computer crashes, cause every OS sucks
